

Inventions to Help the Planet and Create Convenience

Department of Electrical Engineering Professor, Qiu Jian-qing, has this year submitted two inventions for patent application. The first one is a wind and solar energy device that, if patented, could lessen the energy consumption associated with using telecommunication appliances. The second is a GPS helmet. In his invention, a GPS display appears magically on the glass front visor of one' s motorbike helmet. This would afford motorcyclists the same luxury already enjoyed by regular vehicle drivers, of having a global mapping system available at the touch of a screen.
